NSWPCN Predictor Training

March 24, 2015

1 Preparation

```
library(survival)
library(glmulti)
library(flexsurv)
library(randomForestSRC)

library(reshape2)
library(plyr)
library(ggplot2)

library(MASS)
library(boot)
library(timeROC)

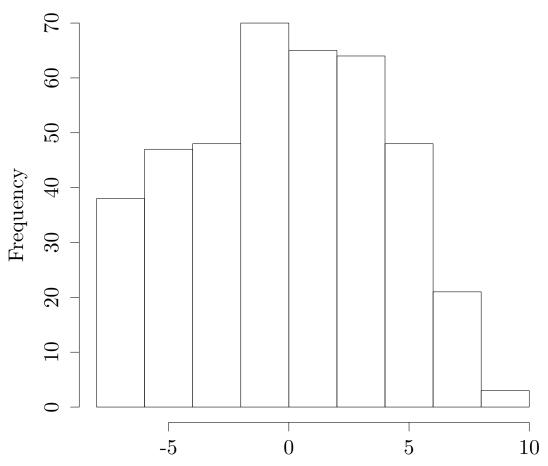

load("03_NSWPCN_subset.rda")

library(RColorBrewer)
pal = brewer.pal(4, "Dark2")
names(pal) = c("GG", "CPH", "RSF", "KMO")
```

2 Cohort selection and transformation

```
data$SexM = data$Patient.Sex == "M"
data$Ca199 = data$Path.Ca199.Preop > 100
data$DiagYearCent = as.numeric((data$History.Diagnosis.Date - median(data$History.Diagnosis.Date)) / 363
data$Time = as.numeric(data$History.Death.Date - data$History.Diagnosis.Date)
data$DSD = data$History.DSDeath.Event == 1
data$AgeCent = data$History.Diagnosis.AgeAt.Cent
data$LocBody = data$Path.LocationBody
data$SizeCent = data$Path.Size.Cent
data$A2 = data$Molec.S100A2.DCThresh
data$A4 = data$Molec.S100A4.DCThresh
median(data$DiagYearCent)
## [1] 0
hist(data$DiagYearCent, main = "Histogram of Median-Centered Diagnosis Year", xlab = "")
```

Histogram of Median-Centered Diagnosis Ye

```
temp = NA
temp = ls()
rm(list = temp[!(temp %in% c("pal", "data"))])
nrow(data)
## [1] 404
data = data[!is.na(data$Time) & !is.na(data$DSD) & !is.na(data$A2) & !is.na(data$A4) & !is.na(data$LocBenrow(data)
## [1] 256
data = data[data$Time < 3000,]  # Remove long-term survivors, which are very likely to be data in nrow(data)
## [1] 249
data.all = data
nrow(data.all)
## [1] 249
summary(data.all)</pre>
```

3 Data splitting

There's going to be an awful lot of model manipulation and black magic going on. Create a holdout validation set for final model comparison and selection.

```
set.seed(20150201)
sel.val = sample.int(nrow(data), floor(nrow(data)/5))
sel.val = 1:nrow(data) %in% sel.val
mean(sel.val)

## [1] 0.1968

data.val = data[sel.val,,drop = FALSE]
data = data[!sel.val,,drop = FALSE]
nrow(data)

## [1] 200
nrow(data.val)

## [1] 49
```

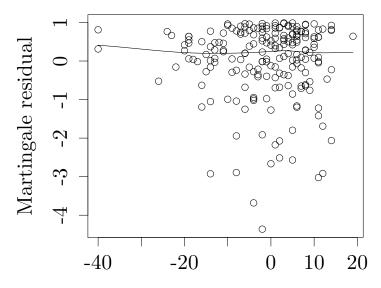

4 EDA

Use the CPH model as a convenient framework for EDA.

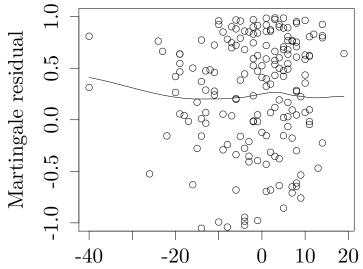

4.1 Functional form

Investigate functional form with martingale residuals.

```
fit.cph.NoAge = coxph(Surv(Time, DSD) ~ DiagYearCent + SexM + LocBody + SizeCent + A2 + A4, data = data) scatter.smooth(data$AgeCent, resid(fit.cph.NoAge, type = "martingale"), xlab = "", ylab = "Martingale resident = "", ylab = "Martingale")
```

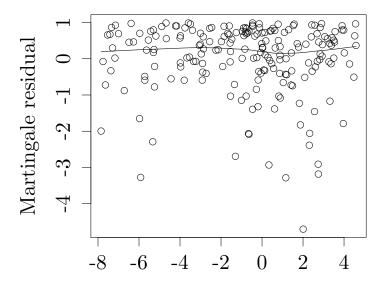

scatter.smooth(data\$AgeCent, resid(fit.cph.NoAge, type = "martingale"), xlab = "", ylab = "Martingale re

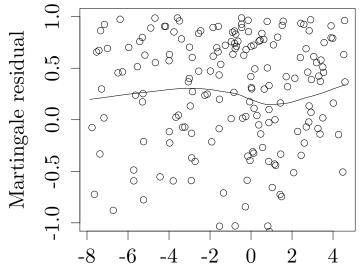

Close enough to linear.

fit.cph.NoDate = coxph(Surv(Time, DSD) ~ SexM + AgeCent + LocBody + SizeCent + A2 + A4, data = data)
scatter.smooth(data\$DiagYearCent, resid(fit.cph.NoDate, type = "martingale"), xlab = "", ylab = "Martingale")

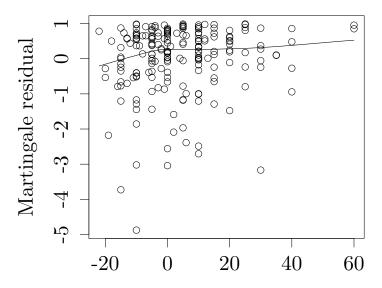

scatter.smooth(data\$DiagYearCent, resid(fit.cph.NoDate, type = "martingale"), xlab = "", ylab = "Martingale")

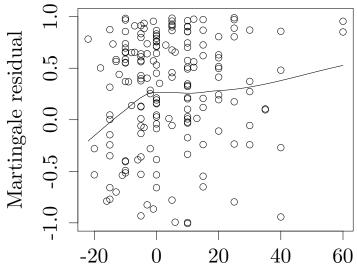

Doesn't appear to have much of an effect.

fit.cph.NoSize = coxph(Surv(Time, DSD) ~ DiagYearCent + SexM + AgeCent + LocBody + A2 + A4, data = data scatter.smooth(data\$SizeCent, resid(fit.cph.NoSize, type = "martingale"), xlab = "", ylab = "Martingale"

scatter.smooth(data\$SizeCent, resid(fit.cph.NoSize, type = "martingale"), xlab = "", ylab = "Martingale"

The size relationship appears to have a knee, close to size ==0, around which the relationship is approximately linear.

Model size as: $SizeCent + SizeCentI(SizeCent > 0) \equiv SizeCent + SizeCent_{+}$

```
data$SizePlus = pmax(data$SizeCent, 0)
data.val$SizePlus = pmax(data.val$SizeCent, 0)
data.all$SizePlus = pmax(data.all$SizeCent, 0)
```

4.2 PH assumption: full model

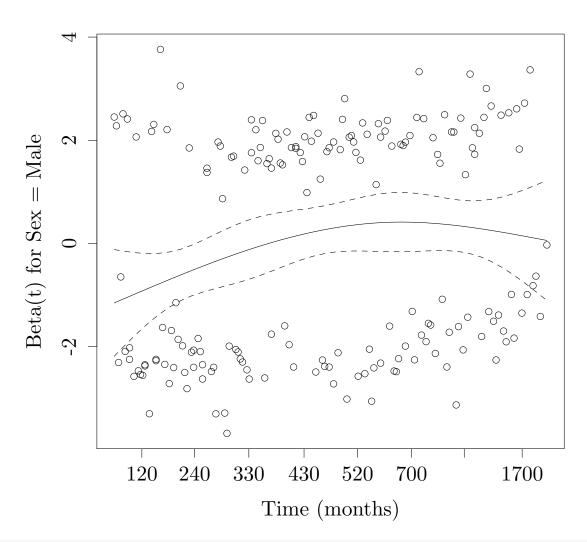

```
data.temp = data
data.temp$Time = data.time$Time/365.25*12

## Error in eval(expr, envir, enclos): object 'data.time' not found

fit.cph = coxph(Surv(Time, DSD) ~ SexM + AgeCent + LocBody + SizeCent + SizePlus + A2 + A4, data = data
cox.zph(fit.cph)
```

```

```

Using a threshold of 0.1 for the CPH tests, sex is stuffing things up. Stratification by sex makes good sense, given known variation in survival between the sexes. It would have been possible to model this with a Sex:Age term in an AFT model, but given this is CPH, a baseline change is needed.
